

Sunshade Sensei

Part1: Time is its own substance

Part2: Growth Ritual

Part3: Physiological origin of time

Part 1:

Within an endless vortex of matter, Time emerges allowing conscious beings to adapt to a new body while developing new senses.

Our bodies have grown around earths environment because of an eternal clock that initially developed static senses.

The Earths' Sun uniquely doesn't burn everything alive on each rotation, we Instead conjoin with other matter unavoidably.

As each of our own unique bodies begin to accumulate mass we also begin to accumulate buoyancy.

Buoyancy of a spirit using our earths static field as a conductor of man has created vastly unique ecological occurrences.

What if time is an empty vessel that created an existence with itself?

How can we be sure of anything without enough exploration,
Man is not shark of water.
Man is Spirit of Time.

Part 2:

Within our existence microscopic organisms live within all biological and ecological substances, --man too accumulates, within a larger substance feeding on the vessel surrounding.

Accept with conscious thought we can decide our own balances by concentrating focus on specific bodily intakes that are cross referenced with results by allowing faster blood flow, Larger muscle capacitors in the body and brain and Harder shells around sockets such as bone and cartilage.

Growth is a push from below our crust from the core that is conjoined with the suns push of radioactive solar flares.

A heart restarts with a strong pulse, essentially the core of both sun, earth and moon create a trifacta of life that has expanded by a constant agitation on settling substances.

Part 3:

Society does not dictate time, only orchestrates the outcome of vibrant patterns.

Time is a manmade scientific explanation, Although without the proper balance of sun rise to set jungles and every other Zen and Green eater could not emerge. However time can fluctuate so

can the adapting life. So theoretically the science we have discovered and labeled our Global time is much like a co-ordinate on a map, a path to follow when the leaders whereabouts are unknown.

With the conscious concept of time society can preserve life by calculating birth cycles. Our universe was born and though we cannot calculate exactly when, we can get a good estimate of how much time could be left in our region.

our steady spiral of time calculates when another inhabitable dimension might open up, and with proper increments "Time Travel" is explained as leaving a building before an explosion is set to go off. So rather than warping somewhere on this earth magically we could possibly open a portal though the universes element slide of matter a white hole is potentially harmless because its the opposite of a blackhole which sucks in matter per second based on its dimensions. A white hole is similar, its most likely not a straw using pressure to pull up, but the gentle slide down.

All outer space is cold for a reason, its the casing that holds us together, similar to muscle on bone. In a few trillion years our galaxy could be emptied such as a drink being sucked dry from countless blackholes. However all of these blackholes likely funneled those substances somewhere in a compressed state of element known as dark matter. Dark matter is what holds the seems of everything together, Dark-matter is extremely dense and like extremely cold dense substances they expand with heat and low pressure. If a white-hole was a billion miles long, traveling without any force based on the circumference of our universe we could say traveling a million miles an hour would have as much back pressure as a 5 mile gust of wind.

This dark matter is much like a flat batter, after 45 million miles it begins to expand. After 250 million miles the nuts begin to emerge, after 750 million miles the moisture is all almost gone, and by 1 billion miles the end of the line where thousands of other ovens are mass producing dark matter muffins accept its not one kind of muffin, its every element all being dumped into a universe with one massive black hole causing cosmic collisions crossing meteors causing friction and eventually combustion, all of which could be avoided while we cultivate a new universe.
